

Dealpad

NextGenApp DealPad

Application Overview & Technical Outline for the NextGenApp Pricing & Scoping 2.0 Initiative

Document Overview

This document is intended to provide a technical requirement summary of recommendations to replace the various Excel scoping templates currently being utilized for pricing workup and approval, while supporting the current and future Quote-to-Cash workflow processes and technology integration requirements.

The recommended solution is not intended to replace any current pricing methodologies but instead refactor the current technology offering (Excel) and digitize the process operations enabling enhanced Q2C process technology alignment. The specific goals of this technology refactoring event are to:

- Increase timeliness of enrichment-ready data captured during the sale process
- Align data captured to key system fields and attributes to support and streamline workflows
- Reduce redundant data entry and handoffs across systems and teams
- Create a scalable architecture that allows for flexible pricing methodologies resulting in

consistent integration pipelines across NextGenApp systems

This document is not intended to represent the final product design.

Utility Overview

Process Technology Alignment

The current Excel-based pricing and scoping model places the workflow and data outside of the current Q2C technology path, resulting in misaligned data components with no capacity for workflow integration.

The result of misaligned data capture for the specific 'scope items' within the process, near guarantees multiple handoffs or offline files across workflow teams.

Q2C Enterprise Systems & Sub-stream Application Workflows Overview

By adjusting where Pricing & Scoping starts, supporting a data-forward enrichment strategy, we can collect all elements required to better support proceeding process technologies. Current State – Process Technology

Recommended State – Process Technology

Workflow & Fulfillment Technologies

NextGenApp's Workflow and Fulfillment Technologies operate in two data and execution tiers;

- Workflow Tier – Workflow tier apps traditionally initialize and execute at a level lower than traditional 'Service Types'. While the firm mainline operations note items such as

'Individual

Return', these applications operate at a 'Scope Item' level with specifics such 'Tax Form ID',

'Project Template', Delivery Model, 'Binder Template', etc...

o Examples of these applications are Wrike, XCM, CCH Axcess, CaseWare, FreshDesk,

Karbon, NextGenApp Access

• Mainline ERP (Workday) controlling items such as Project Economic, Budgeting & Forecasting,

and Resource Management, operating from manageable levels of detail such as Service Type,

but additionally need unit-based details specific to their operating functions.

o Examples of this are "Hours by Skill", Budget Values (Hours * Rate)

Given the rate of change in NextGenApp's growth strategy for deliverables, it would be of detriment to try

and master all these varying dimensions across the system (governance of system fields would limit

speed to market and slow down the sales process).

The data pad is intended to piece together these elements, enabling sales agility and providing controls

that support our current change rate and paths to market.

DealPad, P&S Modeling Utility

This tool is intended to use a modeling and assembly strategy, pairing together sales formulative logic

(derived and resulted from Phase 1 of Pricing & Scoping), while staging key data elements that support

the workstream systems individual needs.

Wireframes & Process Walk Through

Workflow Outline

• Start by loading deal construct in CRM

o CRM Data

▪ Sold To Customer/Prospect

▪ Service Types

▪ Included Entities

o Process Technology Considerations

▪ Should users be able to add to a CRM opportunity from this console (add a service, add an entity, and an alignment)?

• Trigger (Button Push) Deal Pad Initiation

• Deal Construct Walk through

o Primary Assumptions & Prompts (additional will apply)

▪ Rate Sheet (Cost & Revenue)

▪ On/Off-Shore

- Start Date
- Work Year (Filing/Audit Year, Service Contract Year)
- o Assembly Questions
 - Header Questions
 - Difficulty
 - Customer Budget
 - Risk Multiplier
 - Other Examples
- o Move to Next Level of Assembly Questions (via Next/Wizard Button)
 - Secondary Consideration Prompts based on above selection criteria (# of States as example)
 - Other Examples
- o Finish Questionnaire, Move to Grid
- o Grid View
 - Core Grid
 - Breakdown of entities and services by row
 - Skill ID as Header
 - Grid Cells contain calculated values from Assembly
 - User Modification
 - Allow user to update grid calculation results (rounding, reapplication, etc... as example)
 - Future State
 - Re-order grid in other fashions? By Service, Roll-ups, etc...?

System Configuration

Certain elements will require configuration within this software given corresponding application limitations to process. Examples include:

- Rate Sheet Values (Skills)
- Additional TBD

Assumptions & Knowns for User Requirements

- Will be added as scope reaches further definition

Items & Assemblies

As noted above, this tool will introduce 4 new elements to the NextGenApp Pricing & Scoping technology space. These elements are Scoping Items, Pricing Items, Assemblies, and Prompts.

Scope Items

'Price Items' serve as the Mainline ERP detail required to perform a 'Cost Workup' (estimate) of any given deliverable. Price items will capture any unit (or flat) pricing (depending on scenario) and related integration key required to meet the scope item it is associated with. These 'quantities' find monetary value via Rate Sheet multiplication in both Cost and Revenue scenarios.

Commented [EF1]: Should document plan to collect and verify operational definitions around Functional price items ie deliverables, tasks, services, products, etc. whatever we plan to price by; today appears to vary by business area.

Commented [MB2R1]: Good call out. Skill IDs are equated for cost purposes, but in no way effect method of delivery (how they're used). Cost by staff, but is that staff a PM, a trainer, a consultant? The roles are what equates to actual planning (what they're doing), this is strictly for cost/margin workup

Price items hold integration keys for systems requiring estimation values (such as budgeting or forecasting; Workday/Dayshape) and can be flexible depending on downstream system requirements (e.g. Grade or Role).

Assemblies & Prompts

- Prompts are simple questions, used to drive multipliers to assemblies
- o Prompts can be applied at multiple levels depending on the assembly
- o Answers create factored multipliers for indented calculations
- o Prompts may need to persist across multiple assemblies
- Assemblies are the base construct of tool, consisting of:
 - o Scope Item (as a Header) – Items are factored at unit level of 1
 - o Child Components to Scope Items – Can be many child components to a single scope item

- Price Item

- Utilizes a multiplier to achieve the base scope item unit level of 1 (.5 Manager for each 1 Scope Item, as an example)
- These items are often intended to be integration or reporting levels of data
 - Scope Items (as child component) – There may be additional scope items as children to the primary
- This drives recursive calculation
- Most commonly will have a prompts associated (# of States, as example)

Assumptions & Risks to Architecture

- It is assumed that we will not have multiple versions of the same Scope Item Assembly for each

Service Type & Cost Center Combination

- o We can have an Individual Return for CC123 and specific items, and Individual return for

CC124 and specific items, but not two different versions of Individual Return for CC123

- To limit an unmanageable amount of Scope item variance, scope Items should be limited to areas where 'actual' values can be applied for comparative reference (estimated vs actual via system analytics)

Data Integration Requirements

Data Integration Requirements

DealPad Tables & Data

The following field elements and tables are recognized as 'gaps' in current Q2C technology

infrastructure and will require custom fields and tables to support the proposed operating technology.

Object/Table	Fields	Comments / Notes
DealPad (Header)	Opportunity GUID, DP System Key, Version #, Status/State, Relevant Dates, Seller ID (Emp#)	Adjoining event container key. Ties relevant details (Deal Workup Sheet) together
DealPad Worksheet (Details)	DP System Key, Account GUID, Service Type, Deal Scope Item ID, Price Item ID, Quantity, Unit Price, Ext Total	- Used to store Grid/Details of the estimate workup - Account (Customer/Prospect), Service Type, Scope Item, Price Item, Quantity, and Rate Sheet multiplier (* Quantity) values
DealPad Scenarios (Prompt Answers)	DP System Key, Deal Scope Item ID, Rate Sheet, Response/Answer Value	- Used to store answers (responses) from prompts, enabling the retriggering of calculations from scratch (if needed) - Examples include (but are not limited to) "Off/On-shore"
DealPad Prompts	DP System Key, Service Type, Cost Center, Question/Description, Answer Type, Multiplier	This area designates how prompts (questions) effect quantities via multiplier
DealPad Scope Assembly	Scope Assembly Key, Description, Enabled Service Types, Enabled Cost Centers, Workflow Template Key	- Scope Item lists are filtered by Service Type & Cost Center configuration - Scope items become key (as your assembly header) when looking to initialize other systems downstream - Tax Binder Templates - Wrike Projects - iManage, Info, etc...
DealPad Price Items	Price Item Key, Description, Workday Staff/Role ID	- Child element to the scope item - Holds Workday association for roles, driving pricing and scheduling integration
DealPad Scope Component	Scope Assembly Key, Price Item Key, Quantity	Component breakdown of the Scope Assembly

Object/Table Fields Comments / Notes

Rate Sheet (Header)	Workday Key, Description, OffShore Identifier, Type (Cost/Revenue)	Workday currently has over 5000 Contract Rate Sheets, reducing usability in it's full list or raw form
Rate Sheet Details (Rows)	Rate Sheet Key, Staff/Role ID, Amount	- Workday Rate Sheet lines are currently Employee ID - Current pricing is by 'Role'/'Skill', not by employee making synchronization ineffective.

While each of the enterprise systems has extensibility capabilities (CRM, Intapp, Workday), each carries a significant risk.

System	Risks / Issues
CRM	- Current system configuration is over 12 years old - Highly customized, minimal out-of-box feature set deployed increasing cost of basic development - Has open recommendation for reimplementation within next 1 year
Intapp	- Proprietary Architecture System - Not part of core application competency, minimal shared components outside of what is already intended to be integrated - High volume of ongoing growth & development costs could make this option cost prohibitive
Workday	- ERP system - Not ideal to support change velocity of sales processing procedures - Limitations in 'lost' activities (no archive, delete, etc...) - High volume of ongoing growth & development costs could make this option cost prohibitive

It is recommended that Armanino utilize a Microsoft Azure base (Serverless Apps, Tables, etc...) to house this infrastructure for this application.

Microsoft Dynamics CRM (Pre-sale Workflow, Booking Management)

The object and field data elements below are required to support the intended workflow of the application

Data Type	Integration	Data Elements / Objects
Configuration Data	Bi-Directional (R/W)	- Account (Prospect / Non-Customer) Master - Contact Master - Service Type Master - Service Type / Cost Center Association Matrix - Scope Assembly (*New)
Transaction Data	Bi-Directional (R/W/U)	- Opportunity - Opportunity Service Types - Opportunity Included Entities Matrix

Intapp (Conflict & Independence, Intake/Onboarding)

The object and field data elements below are required to support the intended workflow of the application

Data Type	Integration	Data Elements / Objects
Configuration Data	Read	Account (Customer) Master (and Org Tree)
Transaction Data	Write / Update	- Values TBD, Pending Intake Initiative Scope - Potential; Resource Forecast - Potential; Project Budget

Workday & Dayshape (ERP & Resource Management)

The object and field data elements below are required to support the intended workflow of the application

Data Type	Integration	Data Elements / Objects
Configuration Data	Read	- Cost Center Master - RPL Project Role List
Transaction Data	TBD	- Values TBD, Pending Intake Initiative Scope - Probable; Resource Forecast - Probable; Project Budget
